Abstract
The article discusses effective ways to improve the quality of psychological preparation of students for pedagogical activity, where an important criterion is the special training of future teachers in psychologically meaningful pedagogical design. The method of teaching is to create conditions for the formation of a certain psychodidactic model of the lesson in the student's consciousness. An educational and professional constructive task intended for pedagogical practice can act as a means of creating these conditions.

Keywords: education, practice, student, society, country.

I. INTRODUCTION
The modern educational paradigm imposes new requirements on the teacher: the restructuring of educational values and standards, curricula creates an objective need for the teacher to reconsider his own approach to teaching and educating a younger person. The organization of the educational process itself appears no longer as a sophisticated management of the student's activities, not as the formation of his personality set from the outside, but as a developing interaction of the personalities of the teacher and the child.

Apparently, the most vividly creative nature of the teacher's activity is manifested at the stage of developing ideas on how to build a future lesson so that it is a "cell" of the developing system, what conditions need to be created so that schoolchildren become genuine subjects of teaching. The solution of these tasks occurs at school mainly due to the high-quality development of lessons by the teacher. This means that the creative activity of the teacher is realized to the greatest extent in the process of pedagogical construction.

If we consider the creation of conditions for the development and self-development of a growing person to be the highest goal of pedagogical activity, then the well-known requirement for the psychologization of pedagogical activity is perceived as quite natural. In this regard, in this study we are talking about psychologically meaningful pedagogical construction.

II. METHODOLOGY
The methodological basis of the study was made up of: regulatory documents of the federal and
The adaptation of first-year students to the university is determined by three levels: high, which is characterized by an optimal combination of adaptive strategies aimed at mutual change of the personality and the environment; medium, determined by the choice of wait-and-see strategies and low level of adaptation, which is characterized, as a rule, by withdrawal from the environment and isolation.

The factors contributing to the psychological and pedagogical adaptation of first-year students to the educational process of higher education are divided into three blocks: sociological, psychological and pedagogical.

A number of factors have been identified, the complex action of which contributes to the development of the motivational readiness of the subject for a new educational activity, where there is an objective coincidence.
of the motivational orientation of students for personal development with the target settings of the modern education system; personal and individual orientation of the psychological training system, which is built taking into account the specifics of the prevailing real motivation of the subjects of professionalization; purposeful actualization of the action of system-forming factors in the form of motivational-target relations, psychological mechanisms of motivational authorization of activities, as well as increasing the internal motivation of the subject by enriching the content of the activity, which is possible at the level of its conceptual model, operational and regulatory components.

The construction of the scientific and theoretical nature of the educational activity of the university, pedagogical support and pedagogical support of first-year students during the adaptation period is interpreted as a certain system of means that ensure the self-realization of students in the educational process. The levels of readiness of first-year students to adapt at the university are considered as an active state of personality that causes attitudes to professional situations and tasks, as a prerequisite for purposeful activity, its regulation, stability and effectiveness in the form of a sequence of stages: motivational-adaptive and reflexive-transformative.

As criteria of readiness for adaptation at the university, the following were identified: socio-psychological, scientific-pedagogical and professional levels, pedagogical tasks and the content of work with first-year students aimed at increasing the level of adaptation to the educational process of higher school were determined.

V. CONCLUSION

A number of factors, the complex action of which contributes to the development of the motivational readiness of the subject for a new educational activity, where there is an objective coincidence of the motivational orientation of students of personal development with the target settings of the modern education system, have a significant impact on the readiness of first-year students to adapt. Moreover, the initial period of study at the university, the most difficult and responsible, acts as the spatial-temporal continuum of research.

The most adequate means and sufficient basis for solving the problem of adaptation is the development and implementation of a system of pedagogical conditions, which are characterized as an integral pedagogical process, sequence, arrangement of its parts, causing a continuous increase in functions in the development of the student body and personality as a whole. The most important role in the organization of the adaptation process of first-year students is played by the creation of a favorable psychological and pedagogical climate in the group, at the faculty, at the university, as well as timely diagnosis, psychological assistance, support and pedagogical support of the student.
